c) 73.5 - 97.5 , Time 1:48 - 2:25

d) Whole Time Line:

i. Intro: 0:00 - 0:12
ii. Pre-build: - 0:24
iii. Build: - 0:47
iv. Drop: - 1:01
v. Drop2: - 1:13
vi. Transition & Section B: - 1:38
vii. Section B build-up to C: - 1:47
viii. Build-up to C: - 2:00
ix. Drop: - 2:12
x. Drop2 & Outro: - 2:27

b.

a) The sound design for sub-layer drop chord:

This sound is used in the chord in drop section, I have different layers of chord for drop section, because I want to make the drop section sounds cheering and rich, so I use similar sound to layer-up and enrich the whole chord. This is just one of those layers, I use a sawtooth wave as a strong and bright sound to make the whole design strong.Then the Basic Mini wave is a layer that adjust the flavor of the sound.It sounds softer to balance the whole mood. I have a filter1 on the right which basically is a low pass filter that shift from right to left to make the sustain sound smooth. Then for the env1 I have a short Attack0.5ms, no hold, a 1second decay to make the chord sound continued, no sustain, a short release to make it sounds natural.

b) another lead for A buildup section

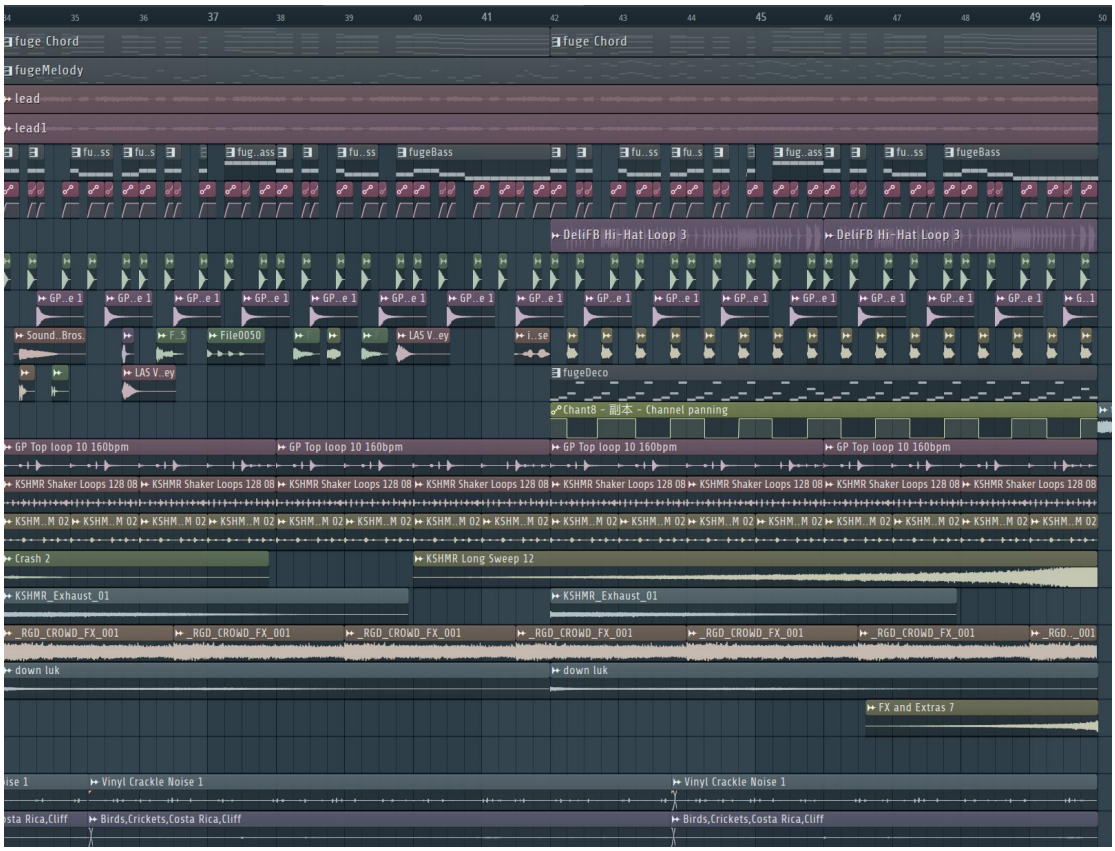

This sound is used at the transition between section A and B, which is the buildup part, I have a lead for the first A part, then for the transition, I want to make the sound sounds more hard and cheering. So this sound is modified based on Sawtooth waves, as you can see, Osc A and B both look like Sawtooth waves, this make the sound harder than the previous lead, which can better transit to the drop part. I have a Noise section to make the sound richer, the filter1 is also a low pass filter, but this LPF only move to the mid-range of the sound, which remain some sharpness to maintain the sound hard.For evn1, I have a 0.9ms attack, no hold, a 2.23s decay and a -13.5dB sustain. Although I have a long decay, I use a balance automation line to control the overall sound outside of serum, so this is not what you hear for the result. For custom effects , I have reverb, delay, EQ and compressor. I boost high range sound in EQ because I want to make the lead sounds like a lead, not a background chord.

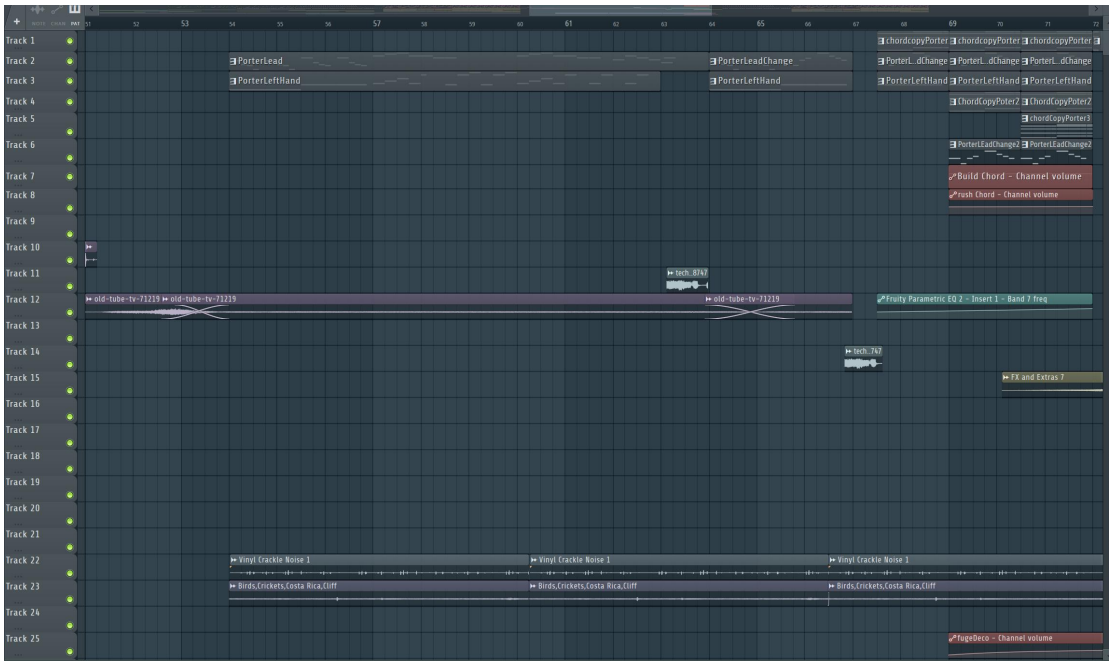

c.

I basically use drum samples for the project, since this is music genre is Kawaii bass so there are also a bunch of sound effects samples. Most of the drum samples are from KSHMR drum sample packs. For the intro part (0:12 - 0:24) I have drums DeliFB Trap Kick 1, KSHMR Snap 01, squeak-45410(this is the bed spring SFX), Water Drop Sound, inori_default_beep(this is the anime girl voice, every SFX start with inori are vocal SFX), then for the buildup part(0:24 - 0:48), I added Drum sticks sound and a DeliFB Hi-Hat Loop 3 for the buildup. The for the drop section(0:49 - 1:13 and 2:00 - 2:25), I modified the drum group. I added GP Roses Snare 1, GP Top loop 10 160bpm(the decoration drum loop), KSHMR Shaker Loops 128 08, KSHMR Shaker Loops 100BPM 02, and a bunch of SFX: Crash 2, KSHMR_Exhaust_01, _RGD_CROWD_FX_001(this is the background audience cheering sound), downluk. Also through out the whole song I have Vinyl Crackle Noise 1 and Birds,Crickets,Costa Rica,Cliff serve as the background white noise, Lo-Fi layers of the song.

d.

This is the drop section of my song, I have a lot of decoration SFX, and for line6(top to bottom) I use a balance automation line to control the volume of the sound, this is more like a side chain for the song.

For section B, I have the SFX old-tube-tv sound cross fade with each other to extend the length. For the build up to C, I use automation line to balance the volume so that people can still hear the guitar sound.

e.

For main channel I just have my EQ and limiter to control the overall spectrum and volume.

Intro Chord / General Chord

This EQ is for general chord, I use a low pass filter to reduce the high-end sharp sound.

“Side Chain”

I use two Balance to create a side-chain like sound effects. I applied them mostly on buildups and drop section.

For delays, I basically add delays for chord because I want the chord be more sustained and fill the background.
